PRECITEC

Low Power Protective Mirror

German Technology

The Best Choice for Laser Cutting Head

High Precision of Production

No Seams in the Cavity of Cutting Head

High Mechanical Strength

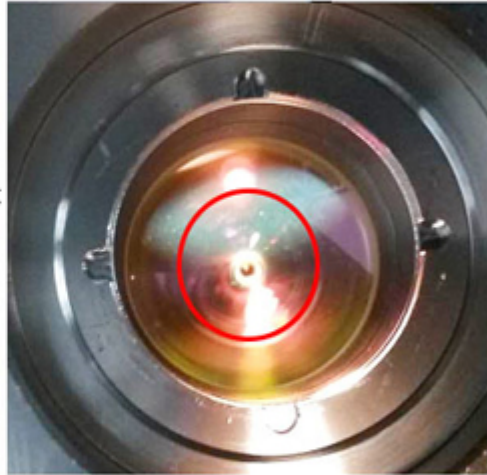

The lens with high mechanical strength can stand with high power of laser beam.

Dust-free

It is dust-free and avoids its focus shaking during cutting as it influences the cutting quality.

Using poor quality protective lens will not only influence its cutting quality but also it is easy to damage the focusing lens. When we do maintenance service for customers, it often happens that there is dust entered the cavity due to poor quality of lens size which results the lens burned (as shown in the red circle on the photo right)

Troubles Attributed to Non-Original Protective Lens.

1. Poor quality of media coating will cause the lens easy to be burned by metal spark flyings.
2. Poor precision of lens where there is dust easier entering the cavity of cutting head will cause focusing lens damage.
